

# Assembly Programming with NASM (and GAS)

DR. ARKA PROKASH MAZUMDAR

# NASM Data Directives

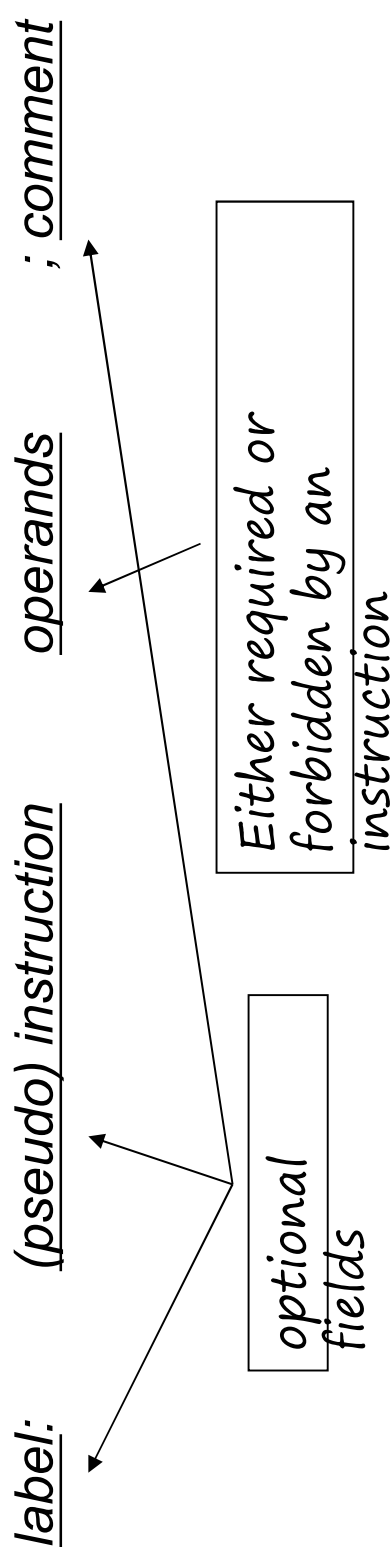

⌞	L1	db	0	; byte
⌞	L2	dw	1000	; word
⌞	L3	db	110101b	; byte
⌞	L4	db	12h	; byte
⌞	L5	db	170	; byte
⌞	L6	dd	1A92h	; double word
⌞	L7	resb	1	; uninitialized byte
⌞	L8	db	'A'	; ascii code = 'A'
⌞	L9	db	0,1,2,3	; 4 bytes
⌞	L10	db	'w','o','r','d',0	; string
⌞	L11	db	'word', 0	
⌞	L12	times 100 db	0	; 100 bytes of zero
⌞	L13	resw	100	; 100*2(word bytes)

# Data Types in IA32 (AT&T format)

C declaration	Intel data type	Assembly code suffix	Size (bytes)
char	Byte	b	1
short	Word	w	2
int	Double word	l	4
long int	Double word	l	4
long long int	—	—	4
char *	Double word	l	4
float	Single precision	s	4
double	Double precision	l	8
long double	Extended precision	t	10/16

# Instruction Basics

Each NASM standard source line contains a combination of the 4 fields:

1. Backslash (\) uses as the line continuation character: if a line ends with backslash, the next line is considered to be a part of the backslash-ended line.
2. No restrictions on white space within a line.
3. A colon after a label is optional.

# Example Program

```
1 int simple(int *xp, int y)
2 {
3     int t = *xp + y;
4     *xp = t;
5     return t;
6 }
```

```
1 simple:
2     pushl
3     movl
4     movl
5     movl
6     addl
7     movl
8     popl
9     ret
```

```
Save frame
Create new
Retrieve x
Retrieve y
Add *xp to
Store t at
Restore fi
Return
```

```
%ebp
%esp, %ebp
8(%ebp), %edx
12(%ebp), %eax
(%edx), %eax
%eax, (%edx)
%ebp
```

# Operand Modes

**Source**   **Destination**

**C Analog**

movl	Imm	{	Reg	movl \$0x4,%eax	temp = 0x4;
			Mem	movl \$-147, (%eax)	*p = -147;
	Reg	{	Reg	movl %eax,%edx	temp2 = temp
			Mem	movl %eax, (%edx)	*p = temp;
	Mem	{	Reg	movl (%eax), %edx	temp = *p;
			Reg		

# NASM Data Directives

⌞	L1	db	0	; byte
⌞	L2	dw	1000	; word
⌞	L3	db	110101b	; byte
⌞	L4	db	12h	; byte
⌞	L5	db	170	; byte
⌞	L6	dd	1A92h	; double word
⌞	L7	resb	1	; uninitialized byte
⌞	L8	db	'A'	; ascii code = 'A'
⌞	L9	db	0,1,2,3	; 4 bytes
⌞	L10	db	'w','o','r','d',0	; string
⌞	L11	db	'word', 0	
⌞	L12	times 100 db	0	; 100 bytes of zero
⌞	L13	resw	100	; 100*2(word bytes)

# Examples

## *Data directives (different to MASM)*

- ▮ `Mov al, [L1]` ; copy byte at L1
- ▮ `Mov eax, L1` ; `eax` = address of byte at L1
- ▮ `Mov [L1], ah` ; copy `ah` into byte at L1
- ▮ `Mov eax, [L6]` ; copy double word
- ▮ `Add eax, [L6]` ; `eax` = `eax` + double word at L6
- ▮ `Add [L6], eax` ; double word at L6 += `eax`
- ▮ `Mov al, [L6]` ; copy first byte of double word at L6 into `al`
- ▮ `Mov [L6], 1` ; operation size is not specified
- ▮ `Mov dword [L6], 1` ; store a 1 at L6

# Instructions: Setup

## ↳ STACK

- ↳ can be used as a convenient place to store data temporarily
- ↳ Also used for making subprogram calls, passing parameters and variables.

↳ Data can only be added in double word units

## ↳ PUSH

- ↳ inserts a double word on the stack by subtracting 4 from ESP
- ↳ And then stores the double word at [ESP]

# Instructions: Setup

- POP

- reads the double word at [ESP]
- And then adds 4 to ESP

- CALL

- Call subprogram
- Make an unconditional jump to a subprogram
- And pushes the address of the next instruction on the stack

# Instructions: Setup

- ↳ RET
  - ↳ Pops off an address
  - ↳ And jumps to that address.
- ↳ When using this inst.: It is very important that one makes sure that the stack is correctly set up so that **the right number is popped** the RET.

# Example

```
void swap(int *xp, int *yp)
{
    int t0 = *xp;
    int t1 = *yp;
    *xp = t1;
    *yp = t0;
}
```

swap:

```
    pushl %ebp
    movl %esp,%ebp
    pushl %ebx
```

} Set  
Up

```
    movl 12(%ebp),%ecx
    movl 8(%ebp),%edx
    movl (%ecx),%eax
    movl (%edx),%ebx
    movl %eax, (%edx)
    movl %ebx, (%ecx)
```

} Body

```
    movl -4(%ebp),%ebx
    movl %ebp,%esp
    popl %ebp
    ret
```

} Finish

# Example (contd.)

```
void swap(int *xp, int *yp)
{
    int t0 = *xp;
    int t1 = *yp;
    *xp = t1;
    *yp = t0;
}
```

Register	Variable
%ecx	yp
%edx	xp
%eax	t1
%ebx	t0

```
movl 12(%ebp),%ecx # ecx = yp
movl 8(%ebp),%edx # edx = xp
movl (%ecx),%eax # eax = *yp (t1)
movl (%edx),%ebx # ebx = *xp (t0)
movl %eax, (%edx) # *xp = eax
movl %ebx, (%ecx) # *yp = ebx
```

# Some Integer Instructions

## Format                      Computation

### Two-Operand Instructions

**addl Src, Dest**                      **Dest = Dest + Src**

**subl Src, Dest**                      **Dest = Dest - Src**

**imull Src, Dest**                      **Dest = Dest \* Src**

**sall k, Dest**                      **Dest = Dest << k**                      Also called **shll**

**sarl k, Dest**                      **Dest = Dest >> k**                      Arithmetic

**shrl k, Dest**                      **Dest = Dest >> k**                      Logical

k is an immediate value or contents of %cl

# Some Integer Instructions

Format	Computation
--------	-------------

## Two-Operand Instructions

<code>xorl Src, Dest</code>	<code>Dest = Dest ^ Src</code>
<code>andl Src, Dest</code>	<code>Dest = Dest &amp; Src</code>
<code>orl Src, Dest</code>	<code>Dest = Dest   Src</code>

# Some Integer Instructions

## Format                      Computation

### One-Operand Instructions

**incl Dest**

**Dest = Dest + 1**

**decl Dest**

**Dest = Dest - 1**

**negl Dest**

**Dest = -Dest**

**notl Dest**

**Dest = ~Dest**

# Operands in X86 (NASM)

- Register: `MOV EAX, EBX`
  - Copy content from one register to another
- Immediate: `MOV EAX, 10h`
  - Copy constant to register
- Memory: different addressing modes
  - Typically at most one memory operand
  - Complex address computation supported
